Database : rge32.seq.*

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

JOURNAL    Submitted (23-OCT-2003) Balzergue S., UMRGV, INRA/CNRS, 2 rue
            Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT    PCR was performed on DNA from transformants of Arabidopsis thaliana
            plants from INRA (Versailles). The DNA fragment (s) resulting from
            the PCR were directly sequenced from the left or the right border
            to determine the genomic sequence flanking the insertion. T-DNA
            derived sequences were removed. Information to order the
            corresponding mutant line and a link to a database providing a
            graphical display of the insertion site are available at
            http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
            been generated in the framework of the French plant genomics
            program 'Genoplante' (http://www.genoplante.com and
            http://genoplante-info.inbio.gen.fr).

2 (bases 1 to 10)

Direct Submission

Balzergue, S.

Submitted (23-OCT-2003) Balzergue S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>).

XX Antisense compound for diagnosis and treatment of infection, inflammation
XX and tumor formation is targeted towards the nucleic acid encoding a
XX member of serine/threonine family of kinases.
XX
XX Claim 3; Col 38; 30pp; English.
XX
XX The present invention describes antisense compounds of about 8-30
XX nucleotides in length targeted to the 5' UTR (untranslated region), 3'
XX UTR or coding region of the nucleic acid encoding human Akt-2, which
XX inhibits the expression of human Akt-2. Human Akt-2 is a member of the
XX Akt/PKB family of serine/threonine kinases. The antisense compounds have
XX antiinflammatory, cytostatic and antiinfectious activities, and can be
XX used in gene therapy. They are useful in inhibiting the expression of
XX human Akt-2 by contacting the cells or the tissues in vitro. They can
XX also be used for diagnosis and treatment of infection, inflammation and
XX tumour formation, and for prophylaxis. The present sequence represents a
XX human Akt-2 phosphorothioate antisense oligonucleotide used in the
XX exemplification of the present invention

XX
XX Novel antisense compound targeted to nucleic acid molecule encoding
XX Damage-specific DNA-binding protein 1, p127, useful for treating animal
XX having disease associated with the protein such as liver cancer, or
XX hepatitis.
XX
XX Page 90; Claim 3; 121pp; English.
XX
XX This invention relates to a novel antisense compound 8 to 50 nucleobases
XX in length targeted to nucleic acid molecule encoding Damage-specific DNA-
XX binding protein 1, p127 where the antisense compound specifically
XX hybridises with and inhibits expression of the damage specific DNA
XX binding protein-1 gene. The compounds of the invention may be used in
XX antisense therapy as an inhibitor of expression of Damage-specific DNA-
XX binding protein 1, p127. The antisense compounds of the invention are
XX useful for inhibiting the expression of damage specific DNA binding
XX protein 1, p127 in cells or tissues and are also useful for treating an
XX animal having a disease or condition associated with expression of p127,
XX such as a hyperproliferative disorder (e.g., cancer such as breast, skin,
XX liver, or haematopoietic cancer), or hepatitis, by inhibiting the
XX expression of p127. All antisense oligonucleotides of the invention are
XX chimeric oligonucleotides (gapmers) 20 nucleotides in length, composed of
XX a central gap region consisting of ten 2'-deoxynucleotides, which are
XX flanked on both sides (5' and 3' directions) by five- nucleotide wings.
XX The wings are composed of 2'-methoxyethyl (2'-MOE) nucleotides. The
XX internucleoside (backbone) linkages are phosphorothioate (P=S) throughout
XX the oligonucleotide and all cytidine residues are 5-methylcytidines. The
XX present sequence represents a damage-specific DNA binding protein 1, p127
XX antisense oligonucleotide of the invention

XX New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
 XX replication and are useful to treat hepatitis C virus infections and
 XX cirrhosis, liver failure or hepatocellular carcinoma.

XX Claim 1; Page 34; 80pp; English.

XX The present invention relates to enzymatic nucleic acids which
 XX specifically cleave RNA derived from Hepatitis C virus (HCV). The
 XX enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
 XX (HP) motif where the binding arms comprise sequences complementary to one
 XX of the substrate sequences defined in the specification. The HCV
 XX ribozymes are useful for modulating the expression and/or replication of
 XX HCV. They can be used to treat cirrhosis, liver failure and/or
 XX hepatocellular carcinoma. The HCV ribozymes are also useful for treating
 XX a condition associated with HCV infection in conjunction with one or more
 XX other drug therapies, particularly type I interferon, especially
 XX interferon alpha, beta or gamma or consensus interferon. The present
 XX sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
 XX Some of the sequence data for this patent did not form part of the
 XX printed specification. The complete sequence data for this patent was
 XX obtained in electronic format directly from the USPTO web site at

XX Detecting tendency to rifampin resistance caused by mutation in RNA
PT polymerase beta-subunit gene of Mycobacterium tuberculosis.
XX Claim 20; SEQ ID NO 19; 27pp; English.
XX The invention relates to a method of detecting a tendency to rifampin
CC resistance caused by mutations in rpoB gene of Mycobacterium tuberculosis
CC comprising extracting DNA from M. tuberculosis cells, amplifying rpoB
CC gene to produce fluorescently labelled product, contacting the labelled
CC product with first and second array of oligonucleotide probes, detecting
CC fluorescent hybridisation signal and correlating with tendency to
CC rifampin resistance. The method is useful for detecting a tendency to
CC rifampin resistance caused by mutations in a rpoB gene of M.
CC tuberculosis. The method is easy to perform and is cost effective to be
CC performed on a large-scale basis. The results produced is reliable and
CC readily detectable. The method is easily adaptable to automation. The
CC present sequence represents a M. tuberculosis probe.

XX Claim 1; Page 47; 120pp; English.
XX AAX30947-31815 represent tag sequences of transcripts that are
XX differentially expressed in colorectal cancer, in pancreatic cancer, or
XX in both. The tag sequences can be used to identify genes by matching the
XX tag to a gen data base member, or by using the tag sequences as probes to
XX isolate unidentified genes from cDNA libraries. The tag sequences can
XX also be used in a method for diagnosing colon or pancreatic cancer in a
XX sample suspected of being neoplastic. The method comprises comparing the
XX level of at least one transcript in a first sample of a tissue to a
XX second sample, where the first sample is a colonic tissue suspected of
XX being neoplastic and the second sample is a normal human colonic tissue.
XX The transcript is identified by a tag selected from AAX30947-31815. The
XX methods of the invention can be used in the diagnosis, prognosis and
XX treatment of cancer

XX

Complex useful for transporting active agent through epithelial barrier,
has biologically active portion and target element directed to ligand
that confers e.g. transcytotic properties to agent specific to ligand.

Disclosure; Page 90; 379pp; English.

The invention described a complex or compound (I) comprising a
biologically active portion and a target element (II) directed to a
ligand that confers transcellular, transcytotic or paracellular
transporting properties to an agent specifically bound to the ligand,
where (II) is not an antibody. Alternatively, (I) comprises two or more
(II) directed to one or more ligands. (I) is useful for delivering a
biologically active agent to an animal, for transporting an active agent
through an epithelial or mucosal barrier, and for treating or identifying
a disease in an animal e.g. diseases of the respiratory system including
lung cancer and tumours, asthma, pathogenic infections, allergy-related
disorders, gastrointestinal tract disorders, disorders relating to
gastrointestinal hormones, Chron's disease, eating disorders and any
disease or disorder involving polyimmunoglobulin receptor (pIgR)
displaying cells. This sequence represents an RNA associated with the
transport of biologically active agents across cellular barriers

 XX New variants of the receptor 5-hydroxytryptamine (serotonin) receptor 1D
 PT gene, useful to identify new drugs for migraine and depression have

PT single nucleotide variations at polymorphic sites.
 XX Claim 15; Page 20; 47pp; English.
 XX The sequences given in AAC85658-69 are allele-specific primers which were
 CC used to identify different gene polymorphisms in the human 5-
 CC hydroxytryptamine (serotonin) receptor 1D (HTR1D) gene. The HTR1D gene
 CC has been discovered to contain 2 new polymorphic sites, 186(A/G) and
 CC 1367(C/G), along with the already known 1350(T/C). The reference sequence
 CC may be used for studying the biological function of HTR1D, and to
 CC identify drugs that target HTR1D for the treatment of disorders related
 CC to it's abnormal expression or function. Such drugs may be used to treat
 CC migraine and other neurological disorders, and depression

 XX
 XX Isolated polynucleotides differentially expressed in antigen-presenting
 PT cells, useful in gene vaccines against cancer.
 XX
 XX Claim 1; Page 102; 130pp; English.
 PS
 XX Sequences AA27573-279709 represent SAGE (serial analysis of gene
 CC expression) tags used to identify mRNA transcripts encoding
 CC immunostimulatory cofactor proteins which are preferentially or
 CC differentially expressed in monocyte-derived dendritic cells compared
 CC with monocytes. Some of the transcripts correspond to known genes or ESTs
 CC (expressed sequence tags) which were previously unknown to be
 CC preferentially or differentially expressed in dendritic cells, while
 CC other transcripts correspond to novel genes. Antigen-presenting cell
 CC (APC)-associated costimulatory factors play an important role in the
 CC activation of the cytotoxic immune response, particularly against tumour
 CC cells. Tumour antigen presentation via the MHC (major histocompatibility
 CC complex) and subsequent recognition by T-cell receptors is alone
 CC insufficient to activate a robust cytotoxic immune response that can lyse
 CC the tumour cells, immunostimulatory cofactors also being required for
 CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
 CC sequences identified using the SAGE tags have several potential uses.
 CC They may be used in vaccines to induce an immune response, particularly
 CC against a tumour antigen; to modulate the genotype of an APC; to screen
 CC for agents that modulate expression of differentially expressed genes in
 CC an APC; and as hybridisation probes/amplification primers for the
 CC diagnosis, prognosis and monitoring of diseases related to abnormal
 CC expression of these genes. Detection of the dendritic cell differentially
 CC expressed genes, or of their encoded proteins, can be used to identify
 CC cells as belonging to the monocyte lineage. Cells containing these genes
 CC can be used in active immunotherapy (or to stimulate production of a
 CC population of antigen-specific effector cells) and vectors containing
 CC them are used in gene therapy. Co-administration of tumour antigens and
 CC APC-associated costimulatory factors ensures adequate antigen
 CC presentation to endogenous APCs and upregulates the APCs for the
 CC presentation of co-stimulatory signals, migration to T cell-rich sites,
 CC secretion of T cell growth factors and secretion of chemokines for
 CC recruitment of immune effector cells

XX WPI; 1993-386203/48.
 XX
 XX New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
 PT with tumours or mRNA expressed from gene encoding multiple drug
 PT resistance.
 XX
 XX Claim 3; Fig 4; 69pp; English.
 PS
 XX The sequences given in AAQ51825-2266 represent areas of mRNAs associated
 CC with development or maintenance of chronic myelogenous leukemia (CML),
 CC promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic
 CC leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast
 CC cancer, colon carcinoma, neuroblastoma and lung cancer. The full length
 CC mRNAs containing these target sequences, encode aberrant cellular proteins
 CC which are able to control cellular proliferation and are directly linked
 CC to a leukemic phenotype. These target sequences are identified by the
 CC ribozyme of the invention. The ribozymes are formed in a hammerhead motif,
 CC but may also be formed in the motif of a hairpin, hepatitis delta virus,
 CC group I intron or RNaseP-like RNA. These ribozymes may be used to inhibit
 CC the development or expression of a transformed phenotype in man and other
 CC animals by modulating expression of the corresponding gene. Cleavage of
 CC target mRNAs expressed in pre-neoplastic and transformed cells elicits
 CC inhibition of the transformed state. Multiple drug resistance (mdr-1)
 CC mRNA specific ribozymes remove the mechanism of drug resistance used by
 CC transformed cells and thus enhances drug therapies for tumours. The
 CC ribozymes may also be used to study genetic drift and mutations within
 CC cells. (Updated on 25-MAR-2003 to correct PN field.)

PT Novel ribozymes for the treatment of diseases and conditions related to
 PT hepatitis C infection.
 XX
 XX Claim 1; Page 64; 123pp; English.
 PS
 XX The present sequence represents the preferred target sequence of an
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
 CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
 CC the descriptor line. The HCV sequence was screened for optimal ribozyme
 CC target sites using a computer folding algorithm and regions of the mRNA
 CC which did not form secondary folding structures and contained potential
 CC ribozyme cleavage sites were identified. Ribozymes were synthesised to
 CC target these sites and their activities optimised by either varying the
 CC length of the binding arms or by modification to prevent degradation by
 CC nucleases. The ribozymes of the invention inhibit gene expression and/or
 CC viral replication, and are used to treat diseases associated with
 CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
 CC hepatocellular carcinoma. The ribozymes may be used in combination with
 CC interferon to treat HCV infection, other infectious diseases, autoimmune
 CC diseases, and cancer

 XX
 XX New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
 PT replication and are useful to treat hepatitis C virus infections and
 PT cirrhosis, liver failure or hepatocellular carcinoma.
 XX

PS Claim 1; Page 34; 80pp; English.

XX The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (HP) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC HCV. They can be used to treat cirrhosis, liver failure and/or
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at
CC seqdata.uspto.gov/psipsDIDEntry.html

PT diagnosis, prognosis and treatment of cancers, particularly colon and
PT pancreatic cancer.
XX
XX Claim 13; Page 60; 120pp; English.
XX
XX AAAX30947-31815 represent tag sequences of transcripts that are
CC differentially expressed in colorectal cancer, in pancreatic cancer, or
CC in both. The tag sequences can be used to identify genes by matching the

tag to a gen data base member, or by using the tag sequences as probes to
CC isolate unidentified genes from cDNA libraries. The tag sequences can
CC also be used in a method for diagnosing colon or pancreatic cancer in a
CC sample suspected of being neoplastic. The method comprises comparing the
CC level of at least one transcript in a first sample of a tissue to a
CC second sample, where the first sample is a colonic tissue suspected of
CC being neoplastic and the second sample is a normal human colonic tissue.
CC The transcript is identified by a tag selected from AAAX30947-31815. The
CC methods of the invention can be used in the diagnosis, prognosis and
CC treatment of cancer

XX
XX Novel ribozymes for the treatment of diseases and conditions related to
PT hepatitis C infection.
XX
XX Claim 1; Page 58; 123pp; English.
XX
XX The present sequence represents the preferred target sequence of an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
CC the descriptor line. The HCV sequence was screened for optimal ribozyme
CC target sites using a computer folding algorithm and regions of the mRNA
CC which did not form secondary folding structures and contained potential
CC ribozyme cleavage sites were identified. Ribozymes were synthesised to
CC target these sites and their activities optimised by either varying the
CC length of the binding arms or by modification to prevent degradation by
CC nucleases. The ribozymes of the invention inhibit gene expression and/or
CC viral replication, and are used to treat diseases associated with
CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
CC hepatocellular carcinoma. The ribozymes may be used in combination with

```

CC interferon to treat HCV infection, other infectious diseases, autoimmune

XX PT New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
XX PT replication and are useful to treat hepatitis C virus infections and
XX PT cirrhosis, liver failure or hepatocellular carcinoma.

XX PS Claim 1; Page 29; 80pp; English.

XX CC The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (HP) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC HCV. They can be used to treat cirrhosis, liver failure and/or
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at
CC seqdata.uspto.gov/paipdbIDentry.html

XX Detecting tendency to rifampin resistance caused by mutation in RNA polymerase beta-subunit gene of Mycobacterium tuberculosis.
PT
XX Claim 19; SEQ ID NO 7; 27pp; English.
PS
XX The invention relates to a method of detecting a tendency to rifampin resistance caused by mutations in rpoB gene of Mycobacterium tuberculosis comprising extracting DNA from M. tuberculosis cells, amplifying rpoB gene to produce fluorescently labelled product, contacting the labelled product with first and second array of oligonucleotide probes, detecting fluorescent hybridisation signal and correlating with tendency to rifampin resistance. The method is useful for detecting a tendency to rifampin resistance caused by mutations in a rpoB gene of M. tuberculosis. The method is easy to perform and is cost effective to be performed on a large-scale basis. The results produced are reliable and readily detectable. The method is easily adaptable to automation. The present sequence represents a M. tuberculosis probe.

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
XX designed to detect single-nucleotide polymorphisms and cytosine
XX methylation status.
XX Claim 1; SEQ ID NO 71499; 29pp + Sequence Listing; German.
XX This invention describes novel oligonucleotide primers or peptide nucleic
XX acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
XX and cytosine methylation status in chemically pretreated genomic DNA. The
XX range of diseases including immune system, gastrointestinal, respiratory,
XX oligonucleotides are used for diagnosis and/or prognosis of cancer and a
XX central nervous system, cardiovascular and metabolic disorders. The
XX oligomers are also used for detecting cell type differentiation. ABC00010

PS
XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

 XX Set of oligonucleotides, useful for diagnosis and cell typing, is
 PT designed to detect single-nucleotide polymorphisms and cytosine
 PT methylation status.
 XX Claim 1; SEQ ID NO 67541; 29pp + Sequence Listing; German.
 XX This invention describes novel oligonucleotide primers or peptide nucleic
 CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
 CC and cytosine methylation status in chemically pretreated genomic DNA. The
 CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
 CC range of diseases including immune system, gastrointestinal, respiratory,
 CC central nervous system, cardiovascular and metabolic disorders. The
 CC oligomers are also used for detecting cell type differentiation. ABC00010
 CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
 CC represent the oligomers described in the invention. NOTE: The sequence
 CC data for this patent did not form part of the printed specification, but
 CC was obtained in electronic format from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.

XX Claim 1; SEQ ID NO 99879; 29pp + Sequence Listing; German.

XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

XX
XX Paramyxovirus vectors with modified transcription initiation sequences
XX for increased expression of foreign genes in production of drugs and
XX vaccines.
XX
XX Example 1; Fig 2; 65pp; Japanese.
XX
XX The present invention describes a paramyxovirus vector DNA in which the
XX transcription initiation sequence has been modified to modify the
XX expression of a gene located downstream of the transcription initiation
XX sequence. This is useful in the production of mutant paramyxovirus
XX vectors with elevated gene expression and a more rapid proliferation than
XX the wild-type vector, which can then be used for more efficient
XX production of drug substances and vaccines

PT complementary sequences in pre-rRNA.
XX
XX Disclosure; Page 18; 74pp; English.
PS
XX
XX The invention comprises a method of screening for antibiotic agents. The
CC method involves disrupting binding of the 5' and 3' hinge regions of
CC domain I of U3 small nucleolar RNA (snRNA) to complementary sequences in
CC the ribosomal RNA precursor (pre-rRNA). Thereby preventing processing of
CC the pre-rRNA into a functional 18S rRNA subunit of the cellular
CC translation machinery. The method of the invention is useful in screening
CC for antibiotics which can be used to inhibit cell growth of infectious
CC organisms and/or treat opportunistic infections in eukaryotic hosts (i.e.
CC humans and domestic animals). The antibiotics identified by the method of
CC the invention may be used to treat opportunistic infections in humans
CC (e.g. fungi, protozoa and multicellular parasites, Chagas disease caused
CC by Trypanosoma cruzi, and pneumocystis carinii infections in
CC immunocompromised hosts). The antibodies identified by the method of the
CC invention may also be used to treat infections in domesticated animals
CC (e.g. coccidiosis in poultry caused by infection with Eimeria). The
CC present RNA sequence represents the Hansenula wingei U3 snRNA 3' hinge
CC region. (Updated on 29-AUG-2003 to standardise OS field)

XX Isolated polynucleotides differentially expressed between metastatic and
 PT non-metastatic breast cancer cells, useful for diagnosis, prevention and
 PT treatment of cancer.

XX Claim 1; Page 133; 219pp; English.

XX AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
 CC that are preferentially transcribed in the metastatic breast tumour
 CC tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
 CC to AAZ86677 represent tags corresponding to distinct transcripts that are
 CC preferentially transcribed in the primary or non-metastatic breast tumour
 CC tissue (i.e. are downregulated in metastatic breast tumour cells). These
 CC transcripts can be used for diagnosis, prognosis, monitoring and
 CC treatment of breast cancer, particularly where metastatic. Diagnosis is
 CC by standard immunoassays or hybridisation/amplification reactions.

XX Compounds that modulate expression of the transcripts are potentially
 CC useful for treatment of (metastatic) breast cancer, while promoters from
 CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences),
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines. Polypeptides encoded by the transcripts are also useful in
 CC vaccines; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

XX PT Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.

XX PS Example; Page 63; 419pp; English.

XX CC The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064

XX PT Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.

XX PS Example; Page 59; 419pp; English.

XX CC The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially

CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
 CC represent SAGE tags used in the exemplification of the present invention.
 CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
 CC method, in the exemplification of the present invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
 PT gene expression (SAGE) tags, useful for studying, monitoring and
 PT affecting phases of the cell cycle.

PS Example; Page 40; 419pp; English.

XX The present invention describes an isolated DNA molecule comprising a
 CC coding sequence of a yeast gene selected from a group of 745 NORF (not
 CC previously assigned open reading frame; or nonannotated ORF) genes
 CC comprising a SAGE (serial analysis of gene expression) tag. Also
 CC described are: (1) a method (M1) of using NORF genes to affect the cell
 CC cycle comprising administering a NORF gene whose expression varies by at
 CC least 10% between any two phases of the cell cycle selected from log
 CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
 CC antifungal drugs comprising: (a) contacting a test substance with a yeast
 CC cell; and (b) monitoring expression of a NORF gene whose expression
 CC varies as in M1, where a test substance which modifies the expression of
 CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
 CC identifying human genes which are involved in cell cycle progression
 CC comprising contacting human DNA with a probe which comprises at least 10
 CC contiguous nucleotides of a NORF gene whose expression varies as in M1;

CC and (4) a method (M4) for identifying a candidate drug as a member of a
 CC class of drugs having a characteristic effect on gene expression in a
 CC yeast cell comprising contacting a yeast cell with a candidate drug and
 CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
 CC represent SAGE tags used in the exemplification of the present invention.

XX New haplotypes of human apolipoprotein C-IV gene, useful to diagnose and
 PT treat diseases associated with its activity such as hypertriglyceridaemia.

PS Claim 18; Page 14; 64pp; English.

XX The invention relates to haplotyping the apolipoprotein C-IV (APOC4) gene
 CC of an individual, comprising determining if the individual has one of the
 CC APOC4 haplotypes or haplotype pairs fully defined in the specification.
 CC Haplotyping the APOC4 gene of an individual, comprises determining the
 CC identity of the nucleotide at two or more polymorphic sites in one copy
 CC of the gene. The method also comprises identifying an association between
 CC a trait and a haplotype or haplotype pair of the APOC4 gene, comprising
 CC comparing the frequency of the haplotype/pair in a population exhibiting
 CC the trait with that of a reference population. A higher frequency in the
 CC trait population indicates the trait is associated with the haplotype.
 CC The polymorphisms and screened compounds are useful for developing
 CC treatment for diseases associated with APOC4 activity such as
 CC hypertriglyceridaemia. AAS95580-AAS95634 represent human apolipoprotein C
 CC -IV allele-specific oligonucleotides of the invention

XX The invention relates to in vitro identification (M1) of genes expressed
in the skin of humans or animals by subjecting a mixture of genetically
encoded factors from skin, to serial analysis of gene expression (SAGE)
so as to identify skin-expressed genes and quantify their expression.
(M1) is useful for identifying genes involved in skin homeostasis; to
determine skin homeostasis and to test agent (A) that maintains or
promotes skin homeostasis or that can be used for treating skin
disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
skin. The present sequence is that of a human expressed sequence tag

XX CC This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.
XX Claim 1; SEQ ID NO 259399; 29pp + Sequence Listing; German.
XX This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX Identifying, comparing and detecting inhibitors of protein-protein
 PT interactions within population of host cells, involves detecting
 PT regulation of transcription of nucleic acid sequence by fusion protein
 PT interaction.

XX Example; Col 131; 161pp; English.

XX The present invention describes a method for detecting (D) at least 1
 CC protein-protein interaction (PPI) by recombinantly expressing within a
 CC population of host cells, populations of first and second fusion proteins
 CC comprising DNA binding domain (DBD) and transcriptional regulatory domain
 CC (TRD) respectively and detecting the regulation of transcription of
 CC nucleotide sequence of host cells operably linked to a promoter driven by
 CC DBD. The detection method (D) is useful for identifying inhibitors of PPI
 CC for therapeutic use, and for detecting specific cell types, tissue types,
 CC stage of development and disease states. From the population of the
 CC proteins characteristic of the particular tissue or a cell-type, all
 CC possible detectable PPI that occur can be identified and genes encoding
 CC these proteins can be isolated. Thus, parallel analysis of two cell types
 CC enumerates PPI that are common to both and those that are specific to
 CC both. This analysis has significant value since PPI specific to a disease
 CC state can serve as therapeutic points of intervention. Inhibitors of PPI
 CC can also be isolated in rapid fashion. The number of false positives and
 CC low throughput are reduced. AAA55843 to AAA55963 and AA90961 are
 CC sequences used in the exemplification of the present invention

PT Detecting protein-protein interactions in protein populations useful for
PT identifying genes encoding the proteins, and inhibitors of the
PT interactions, by detecting transcriptional regulation leading to reporter
PT gene activation.
XX
PS Example; Col 103-104; 135pp; English.
XX
CC The present invention relates to methods for detecting and isolating
CC genes encoding proteins that interact with each other, via the
CC reconstitution of a transcription factor and hence reporter gene
CC activation. Proteins are fused to either the yeast DNA-binding domain of
CC a transcriptional activator or to the activation domain of a
CC transcriptional activator. The present sequence is a linker used in the
CC present invention as an adapter in the analysis of yeast fusion genes.
CC The present method may be used to identify protein-protein interactions
CC and genes encoding the interacting proteins relevant to a particular
CC tissue, stage or disease e.g. cancer

XX Capturing biological binding partner, useful e.g. for nucleic acid
XX hybridization tests, using surface that carries self-assembled monolayer
XX comprising specific capture agent.
XX Example 12; Fig 9; 28pp; English.
XX The invention relates to a new process of capturing a biological binding
XX partner (I) of a nucleic acid strand (II) comprising applying a test
XX sample to a surface that carries: (i) a binding species (III); and (ii) a
XX molecule (IV) that forms a mixed self-assembled monolayer (SAM) with
XX (III). (III) has formula X-R-NA (III) X = functional group that adheres
XX to the surface; R = spacer that promotes formation of SAM; and NA =
XX nucleic acid strand. The method is particularly used in surface plasmon
XX resonance chips (biosensors) for capturing DNA. Typical of many possible
XX applications are DNA hybridisation tests (e.g. diagnostic scanning for
XX mutations, forensic analysis, pharmacological studies, cell sorting,
XX environmental monitoring) in studies of protein-protein interactions
XX where DNA binding is important (e.g. transcriptional control of genes)
XX and in development of easy-analysis DNA computers. The use of a mixed SAM
XX improves sensitivity, with reduced non-specific binding, it ensures that
XX the binding region of (III) is directed away from the surface, making it
XX available for reaction. The present sequenc contains is used to
XX illustrate the method of the invention

XX
XX PT Detection of protein to protein interactions amongst two protein
XX PT populations useful e.g. to identify interactions specific for particular
XX PT tissues or diseases and to identify inhibitors of interactions uses a new
XX PT genetic method.
XX
XX PS Example; Col 197; 152pp; English.
XX
XX CC The present invention relates to novel methods for detecting protein to
XX CC protein interactions amongst two populations of proteins, each having a
XX CC complexity of at least 100. The method involves using new genetic methods
XX CC in which encoded proteins are fused to either the DNA-binding domain of a
XX CC transcriptional activator or the activation domain of a transcriptional
XX CC activator. The methods are useful to detect interacting proteins and to
XX CC identify protein-protein interactions specific for a particular species,
XX CC tissue, stage of development or disease state, e.g. by comparing protein-
XX CC protein interactions between populations from cDNA of cancerous or pre-
XX CC cancerous cells with those from non-cancerous cells. They are also useful
XX CC to identify inhibitors interfering with protein-protein interactions e.g.
XX CC potential drug candidates inhibiting interactions specific to cancerous
XX CC cells. The present sequence is a linker DNA used to illustrate the method
XX CC of the invention

PT designed to detect single-nucleotide polymorphisms and cytosine methylation status.

XX
1770-1779

XX

CC This invention describes
CC acid (PNA) oligomers for

CC and cytosine methylation status in oligonucleotides are used for diagnosis

range of diseases in central nervous system

CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at
CC www.int/pub/epub/pct_sequences

XX
XX Set of oligonucleotides, useful for diagnosis and cell typing, is
XX designed to detect single-nucleotide polymorphisms and cytosine
XX methylation status.
XX
XX Claim 1; SEQ ID NO 126206; 29pp + Sequence Listing; German.
XX
XX This invention describes novel oligonucleotide primers or peptide nucleic
XX acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
XX and cytosine methylation status in chemically pretreated genomic DNA. The
XX oligonucleotides are used for diagnosis and/or prognosis of cancer and a
XX range of diseases including immune system, gastrointestinal, respiratory,
XX central nervous system, cardiovascular and metabolic disorders. The
XX oligomers are also used for detecting cell type differentiation. ABC00010
XX -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
XX represent the oligomers described in the invention. NOTE: The sequence
XX data for this patent did not form part of the printed specification, but
XX was obtained in electronic format from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

CC This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and AB100010-AB182073

 XX Isolated polynucleotides differentially expressed in antigen-presenting
 PT cells, useful in gene vaccines against cancer.
 PT
 XX Claim 1; Page 86; 130pp; English.
 PS
 XX Sequences AA277573-279709 represent SAGE (serial analysis of gene
 CC expression) tags used to identify mRNA transcripts encoding
 CC immunostimulatory cofactor proteins which are preferentially or
 CC differentially expressed in monocyte-derived dendritic cells compared
 CC with monocytes. Some of the transcripts correspond to known genes or ESTs
 CC (expressed sequence tags) which were previously unknown to be
 CC preferentially or differentially expressed in dendritic cells, while
 CC other transcripts correspond to novel genes. Antigen-presenting cell
 CC (APC)-associated costimulatory factors play an important role in the
 CC activation of the cytotoxic immune response, particularly against tumour
 CC cells. Tumour antigen presentation via the MHC (major histocompatibility
 CC complex) and subsequent recognition by T-cell receptors is alone
 CC insufficient to activate a robust cytotoxic immune response that can lyse
 CC the tumour cells, immunostimulatory cofactors also being required for
 CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
 CC sequences identified using the SAGE tags have several potential uses.
 CC They may be used in vaccines to induce an immune response, particularly
 CC against a tumour antigen; to modulate the genotype of an APC; to screen
 CC for agents that modulate expression of differentially expressed genes in
 CC an APC; and as hybridisation probes/amplification primers for the
 CC diagnosis, prognosis and monitoring of diseases related to abnormal
 CC expression of these genes. Detection of the dendritic cell differentially
 CC expressed genes, or of their encoded proteins, can be used to identify
 CC cells as belonging to the monocyte lineage. Cells containing these genes
 CC can be used in active immunotherapy (or to stimulate production of a
 CC population of antigen-specific effector cells) and vectors containing
 CC them are used in gene therapy. Co-administration of tumour antigens and
 CC APC-associated costimulatory factors ensures adequate antigen
 CC presentation to endogenous APCs and upregulates the APCs for the
 CC presentation of co-stimulatory signals, migration to T cell-rich sites,
 CC secretion of T cell growth factors and secretion of chemokines for

```
CC recruitment of immune effector cells

XX Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.

XX PS Claim 1; Page 118; 219pp; English.

XX AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based

CC vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effector cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

XX Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

XX PS Example; Page 78; 419pp; English.

XX The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a

CC yeast cell comprising contacting a yeast cell with a candidate drug and
 CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064

New genetic variants having polymorphisms in the chemokine binding
 protein 2 (CCBP2) gene, useful for studying CCBP2 functions, and for
 treating disorders affected by expression or function of the CCBP2
 isogene.
 XX
 PS Claim 15; Page 14; 84pp; English.

XX The invention relates to an isolated polynucleotide comprising genes and
 CC haplotypes of the chemokine binding protein 2 (CCBP2) gene. Polymorphic
 CC variants of the CCBP2 gene are useful in studying the expression and
 CC function of CCBP2, and in expressing CCBP2 proteins for use in screening
 CC candidate drugs for treating diseases associated with CCBP2 activity.
 CC Polynucleotides comprising a polymorphic gene variant or fragment may be
 CC used for therapeutic purposes, where a patient could benefit from
 CC expression or increased expression of a particular CCBP2 protein isoform,

CC or an expression vector encoding the isoform may be administered to the
 CC patient. Haplotype information is useful in improving the efficiency and
 CC output of several steps in drug discovery and development process,
 CC including target validation, identifying lead compounds, and early phase
 CC clinical trials. The polynucleotides of the invention can be used to
 CC treat disorders related to the CCBP2 gene by gene therapy. This
 CC polynucleotide sequence represents a preferred ASO primer for detecting
 CC CCBP2 gene polymorphisms relating to the invention

Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance
 toward phosphodiesterase digestion, and form stable duplexes with DNA and
 RNA strands.

PS Disclosure; Page 53; 101pp; English.

XX The specification describes oligodeoxyribonucleotides having contiguous
 CC nucleoside subunits joined by intersubunit linkages, where at least 3
 CC contiguous subunits are joined by phosphoramidate intersubunits. The
 CC oligodeoxyribonucleotides has a sequence of nucleoside subunits effective
 CC to form a duplex with a target nucleic acid molecule. The
 CC oligodeoxyribonucleotides are more resistant to nuclease digestion and
 CC have improved RNA and dsDNA hybridisation characteristics, relative to
 CC oligonucleotides not containing N3'-P5' phosphoramidate linkages. They
 CC also have excellent antisense activity against complementary mRNA targets
 CC in in-vitro cell growth inhibition assays. They also exhibit low
 CC cytotoxicity. They may be used in diagnostic and therapeutic
 CC applications, e.g., in combatting infectious agents such as bacteria,
 CC viruses, etc. or in treatment of smooth muscle cell proliferation
 CC disorders, inflammatory processes, certain genetic disorders, cancers,

CC etc. . The present sequence represents an oligonucleotide of the invention

PS
XX
XX This sequence represents an example of an oligonucleotide containing
CC novel 3'-amino-5'-phosphoramidite nucleoside of the invention. The
CC sequence is generated synthetically by using an amine-exchange reaction
CC of phosphoramidites in which a deprotected 3'-amino group of an
CC oligonucleotide chain is exchanged for the amino portion of a 5'-
CC phosphoramidite with a protected 3' amino group. The resulting
CC phosphoramidite internucleotide linkage is oxidised to form a stable
CC protected phosphoramidate linkage

PT bacteria.
XX
XX Disclosure; Col 23-24; 168pp; English.
XX
XX The present sequence represents a potential triple-helix forming region.
CC It can be used to demonstrate the assay of the invention. The assay
CC comprises adding a sample containing double-stranded DNA test sequences,
CC e.g. containing the present sequence, to an aqueous medium containing at
CC least one complex of anchor DNA, attached to a solid support, and
CC reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC designed to form a triple-strand structure with part of the test
CC sequence. Triplex formation results in displacement of the reporter DNA
CC which is detected as an indication of the presence of the DNA test
CC sequence. The method is used to detect DNA sequences, particularly for
CC identification of bacteria (by detecting genes for ribosomal RNA) in
CC clinical samples, but also detection of oncogenes and Hepatitis B virus

XX Identifying genes involved in skin stress and aging, useful e.g. in
PT
```

PT screening for cosmetic or therapeutic agents, based on differential gene expression.

PS Claim 8; Page 79; 325pp; German.

XX The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention

PT Single stranded circular oligo:nucleotide comprising parallel and or anti
PT -parallel binding domain - used to regulate biosynthesis of DNA, RNA or
PT protein in targetted mammalian tumour cell in vivo.
XX
PS Example 11; Page 135; 195pp; English.
XX
CC The sequences given in AAT42898-901 are single stranded (ss) circular
CC oligonucleotides and their targets, which are used in the inhibition of
CC the proliferation of myeloid leukaemia cells. These oligos are
CC specifically targetted to a region in the bcr3/abl2 gene 385 nucleotides
CC 5' to the bcr/abl junction, abd towards the bcr2/abl2 junction. These ss
CC circular oligonucleotides comprise a parallel binding (P) domain, and/or
CC an anti-parallel binding (AP) domain, and at least 1 loop domain. The P
CC and AP domains have sufficient complementarity to bind detectably to 1
CC strand of a defined nucleic acid target. The P domain is capable of
CC binding in a parallel manner to the target. The AP domain is capable of
CC binding in an anti-parallel manner to the target and the ends of the P
CC and AP domains are separated by the loop domains. The ss circular
CC oligonucleotides can be used to regulate the synthesis of DNA, RNA or
CC protein (pref. by DNA replication, DNA reverse transcription, RNA
CC splicing, RNA polyadenylation, RNA translocation or protein
CC translocation) by binding a target sequence in the template. They can
CC also be used to deliver a drug to a specific cell type by administering a
CC drug covalently bound to them (i.e. to regulate the biosynthesis of DNA,
CC RNA or protein in a targetted mammalian tumour cell in vivo, without
CC substantially altering the biosynthesis of the DNA). They can also be
CC used to detect a target nucleic acid by detecting an oligonucleotide-
CC target complex. The circular oligonucleotide can bind both single and
CC double stranded target nucleic acids, and has enhanced stability,
CC compared to linear forms

PT Identifying, comparing and detecting inhibitors of protein-protein
PT interactions within population of host cells, involves detecting
PT regulation of transcription of nucleic acid sequence by fusion protein
PT interaction.
XX
PS Example; Col 131; 161pp; English.
XX
CC The present invention describes a method for detecting (D) at least 1
CC protein-protein interaction (PPI) by recombinantly expressing within a
CC population of host cells, populations of first and second fusion proteins
CC comprising DNA binding domain (DBD) and transcriptional regulatory domain
CC (TRD) respectively and detecting the regulation of transcription of
CC nucleotide sequence of host cells operably linked to a promoter driven by
CC DBD. The detection method (D) is useful for identifying inhibitors of PPI
CC stage of development and disease states. From the population of the
CC for therapeutic use, and for detecting specific cell types, tissue types,
CC proteins characteristic of the particular tissue or a cell-type, all
CC possible detectable PPI that occur can be identified and genes encoding
CC these proteins can be isolated. Thus, parallel analysis of two cell types
CC enumerates PPI that are common to both and those that are specific to
CC both. This analysis has significant value since PPI specific to a disease
CC state can serve as therapeutic points of intervention. Inhibitors of PPI
CC can also be isolated in rapid fashion. The number of false positives and
CC low throughput are reduced. AAA55843 to AAA55963 and AAY90961 are
CC sequences used in the exemplification of the present invention

XX
XX Detecting protein-protein interactions in protein populations useful for
PT identifying genes encoding the proteins, and inhibitors of the
PT interactions, by detecting transcriptional regulation leading to reporter
PT gene activation.
XX
XX Example; Col 103-104; 135pp; English.
XX
XX The present invention relates to methods for detecting and isolating
CC genes encoding proteins that interact with each other, via the
CC reconstitution of a transcription factor and hence reporter gene
CC activation. Proteins are fused to either the yeast DNA-binding domain of
CC a transcriptional activator or to the activation domain of a
CC present invention as an adapter in the analysis of yeast fusion genes.
CC The present method may be used to identify protein-protein interactions
CC and genes encoding the interacting proteins relevant to a particular
CC tissue, stage or disease e.g. cancer

 XX
 PT Detecting protein-protein interactions in protein populations useful for
 PT identifying genes encoding the proteins, and inhibitors of the
 PT interactions, by detecting transcriptional regulation leading to reporter
 PT gene activation.
 XX
 XX Example; Col 103-104; 135pp; English.
 PS
 CC The present invention relates to methods for detecting and isolating
 CC genes encoding proteins that interact with each other, via the
 CC reconstitution of a transcription factor and hence reporter gene
 CC activation. Proteins are fused to either the yeast DNA-binding domain of
 CC a transcriptional activator or to the activation domain of a
 CC transcriptional activator. The present sequence is a linker used in the
 CC present invention as an adapter in the analysis of yeast fusion genes.
 CC The present method may be used to identify protein-protein interactions
 CC and genes encoding the interacting proteins relevant to a particular
 CC tissue, stage or disease e.g. cancer

 XX
 XX Identifying target genes in a microorganism (e.g. Escherichia coli) as a

PT basis for anti-infective treatment comprises selecting potential targets
 PT known to be present and obtaining complementary (antisense) peptide
 PT nucleic acid sequences.
 XX
 PS Claim 31; Page 42; 57pp; English.
 XX
 CC The present invention describes a method of identifying target genes, for
 CC use in anti-infective treatments, in a microorganism, involving obtaining
 CC antisense peptide nucleic acid (PNA) sequences for potential target
 CC genes, mixing them with the organism in culture and comparing the growth
 CC in the presence and absence of the antisense PNA sequence, where a useful
 CC target gene is one which results in decreased growth when blocked by the
 CC antisense sequence. Antisense oligonucleotides are linked to cationic
 CC peptides via a linking group for use as antimicrobial compounds,
 CC particularly as antibiotics. The present sequence is an oligonucleotide
 CC useful as the antisense portion of a PNA in the present invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 156; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
CC represent SAGE tags used in the exemplification of the present invention.
CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC method, in the exemplification of the present invention

 CC comprising a SAGE (serial analysis of gene expression) tag. Also
 CC described are: (1) a method (M1) of using NORF genes to affect the cell
 CC cycle comprising administering a NORF gene whose expression varies by at
 CC least 10% between any two phases of the cell cycle selected from log
 CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
 CC antifungal drugs comprising: (a) contacting a test substance with a yeast
 CC cell; and (b) monitoring expression of a NORF gene whose expression
 CC varies as in M1, where a test substance which modifies the expression of
 CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
 CC identifying human genes which are involved in cell cycle progression
 CC comprising contacting human DNA with a probe which comprises at least 10
 CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
 CC and (4) a method (M4) for identifying a candidate drug as a member of a
 CC class of drugs having a characteristic effect on gene expression in a
 CC yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33288 to AAF44064

 DR Yeast gene coding sequences comprising NORF genes with serial analysis of
 XX gene expression (SAGE) tags, useful for studying, monitoring and
 XX affecting phases of the cell cycle.
 PS Example; Page 84; 419pp; English.
 CC The present invention describes an isolated DNA molecule comprising a
 CC coding sequence of a yeast gene selected from a group of 745 NORF (not
 CC previously assigned open reading frame; or nonannotated ORF) genes
 CC comprising a SAGE (serial analysis of gene expression) tag. Also
 CC described are: (1) a method (M1) of using NORF genes to affect the cell
 CC cycle comprising administering a NORF gene whose expression varies by at
 CC least 10% between any two phases of the cell cycle selected from log
 CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
 CC antifungal drugs comprising: (a) contacting a test substance with a yeast
 CC cell; and (b) monitoring expression of a NORF gene whose expression
 CC varies as in M1, where a test substance which modifies the expression of
 CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
 CC identifying human genes which are involved in cell cycle progression
 CC comprising contacting human DNA with a probe which comprises at least 10
 CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
 CC and (4) a method (M4) for identifying a candidate drug as a member of a
 CC class of drugs having a characteristic effect on gene expression in a
 CC yeast cell comprising contacting a yeast cell with a candidate drug and
 CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33288 to AAF44064

XX New genetic variants having polymorphisms in the retinaldehyde-binding
PT protein 1 gene, useful for studying the function of and for expressing
PT RLBp1 protein for use in screening drugs for treating diseases related to
PT RLBp1 activity.
XX Claim 18; Page 14; 107pp; English.
XX The invention relates to an isolated polynucleotide, which comprises
CC genes and haplotypes of the retinaldehyde-binding protein 1 (RLBp1) gene.
CC The polynucleotide comprises polymorphic sites in the RLBp1 gene, which
CC are referred to as PSL-24 to designate the order in which they are
CC genotyping the RLBp1 gene of an individual, a method for predicting a
CC haplotype pair for the RLBp1 gene of an individual, a method for
CC identifying an association between a trait and at least one haplotype or
CC haplotype pair of the RLBp1 gene, a composition comprising at least one
CC genotyping oligonucleotide for detecting a polymorphism in the RLBp1 gene
CC at a PS consisting of PSL-PS24, a kit for genotyping the RLBp1 gene of an
CC individual comprising a set of oligonucleotides designed to genotype each
CC of PSL-PS24 recombinant non-human organisms transformed or transfected
CC with the isolated polynucleotide, where the organism expresses a RLBp1
CC protein encoded by the first nucleotide sequence or expresses a RLBp1
CC protein encoded by the polymorphic variant sequence, an isolated
CC polypeptide comprising an amino acid sequence that is a polymorphic
CC variant of a reference sequence for the RLBp1 protein or its fragment, an
CC anti-RLBp1 antibody, a method for screening for drugs targeting the
CC isolated polypeptide, and a computer system for storing and analysing
CC polymorphism data for the RLBp1 oncogene gene. The polynucleotide
CC comprising polymorphisms in the RLBp1 gene is useful in studying the
CC expression and function of RLBp1, and in expressing RLBp1 protein for use
CC in screening candidate drugs to treat diseases related to RLBp1 activity
CC (e.g. autosomal recessive retinitis pigmentosa (arRP)). The methods and
CC haplotypes are useful in improving the efficiency and output of several
CC steps in the drug discovery and development process, including target
CC validation, identifying lead compounds, and early phase clinical trials.
CC These are also useful for designing clinical trials of candidate drugs
CC for treating a specific condition or disease, as well as for screening
CC compounds targeting RLBp1 to treat a specific condition or disease
CC predicted to be associated with RLBp1 activity. The kit and method are
CC useful for determining whether an individual has one of the haplotypes or
CC haplotype pairs cited above. The transgenic animals are useful for
CC studying expression of the RLBp1 isogenes in vivo, for in vivo screening
CC and testing of drugs targeted against RLBp1 protein, and for testing the
CC efficacy of therapeutic agents and compounds for retinal diseases in a
CC biological system. The gene for RLBp1 is located on chromosome 15q26. The
CC present sequence is an allele specific oligonucleotide (ASO) PCR primer
CC for amplifying a nucleic acid containing a polymorphic RLBp sequence,
XX using the primer extension method

XX Novel human Nuclear Factor of Kappa Light Polypeptide Gene Enhancer in B-
PT Cells Inhibitor, Beta, (NFKBIB) gene polymorphic variants, useful for
PT screening drug candidates to treat disorders of the immune system.
XX Claim 18; Page 13; 71pp; English.
XX The invention relates to a polynucleotide sequence comprising a human
CC nuclear factor of kappa light polypeptide gene enhancer in B-cells
CC inhibitor, beta (NFKBIB) isogene. The NFKBIB is useful for screening
CC drugs and therapeutic purposes. The polymorphism and haplotype data is
CC useful for validating whether NFKBIB is a suitable target for drugs to
CC treat disorders of immune system, screening for such drugs and reducing
CC bias in clinical trials of such drugs. NFKBIB is useful in studying the
CC effect of variation on the biological activity of NFKBIB as well as on
CC the binding affinity of candidate drugs targeting disorders of immune
CC system. The isolated monoclonal antibody is useful for diagnostic and
CC prognostic formats and therapeutic methods. The genotyping method is
CC useful for determining whether an individual has one of haplotype or
CC haplotype pair. The haplotyping method is useful for improving efficiency
CC and outcome of several steps in discovery and development of drugs for
CC treating diseases associated with NFKBIB activity such as disorders of
CC immune system. The haplotyping method is also useful for validating
CC NFKBIB as a candidate target for treating a specific condition or disease
CC predicted to be associated with NFKBIB activity. The method is also
CC useful for screening compounds to treat a specific condition or disease
CC predicted to be associated with NFKBIB activity. NFKBIB gene is useful in
CC gene therapy and is located on chromosome 19q13.1. The present sequence
CC is human NFKBIB gene polymorphism detecting primer

XX An isolated polypeptide with phosphohydrolase activity, designated
 CD39L2, useful to identify other proteins with which binding occurs or
 PT identify inhibitors and for treatment of, e.g., Alzheimer's, multiple
 PT sclerosis and osteoporosis.

XX Example; Col 56; 101pp; English.

XX The present invention relates to novel proteins with phosphohydrolase
 CC activity, designated CD-39-like (CD39L) proteins and polynucleotides
 CC encoding such proteins. CD39L proteins are useful to treat infectious
 CC diseases caused by viral, bacterial, fungal or other infection that may
 CC be treatable with CD39L. They are useful in the treatment of various
 CC immune deficiencies and disorders, autoimmune disorders such as multiple
 CC sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune
 CC thyroiditis and insulin dependent diabetes mellitus, allergic reactions
 CC and conditions such as asthma and other respiratory problems, periodontal
 CC disease, osteoporosis, osteoarthritis and other tooth repair processes.
 CC They may have utility in compositions used for bone, cartilage, tendon,
 CC ligament and/or nerve tissue growth or regeneration as well as for wound
 CC healing and tissue repair and replacement and in the treatment of burns,
 CC incisions and ulcers. CD39L proteins may also be useful for proliferation
 CC of neural cells and for regeneration of nerve and brain tissue, i.e. for
 CC the treatment of central nervous system diseases such as Alzheimer's

CC disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's
 CC disease, peripheral nervous system diseases peripheral nerve injuries,
 CC peripheral neuropathy and localised neuropathies. They are also used to
 CC treat mechanical and traumatic disorders which involve degeneration,
 CC death or trauma to neural cells or nerve tissue. CD39L proteins of the
 CC invention are also useful to promote better or faster closure of non-
 CC healing wounds, including pressure ulcers, ulcers associated with
 CC vascular insufficiency and surgical and traumatic wounds. They also
 CC exhibit anti-inflammatory activity and may be used to treat inflammatory
 CC conditions including chronic or acute conditions), including ischaemia-
 CC reperfusion injury, endotoxin lethality, arthritis, nephritis, cytokine
 CC or chemokine-induced lung injury, inflammatory bowel disease or Crohn's
 CC disease. The present sequence is human CD39L2 initiation start site

PS
PS This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at

 PT Genotype analysis method, defined as SOMA (short oligonucleotide mass
 PT analysis), of short, defined amplification products using electro-spray
 PT ionization mass spectrometry, useful for analyzing the genotype of living
 PT organisms.
 XX
 PS Example 4; Page 16; 40pp; English.
 XX

The present invention relates to a method of genotype analysis in which
 short PCR products are analysed by electro-spray ionisation mass
 spectrometry (ESI-MS). This method has been named Short Oligonucleotide
 Mass Analysis (SOMA). Short oligonucleotides of the human adenomatous
 polyposis carcinoma (APC) gene variants 486, 545 and 1756 were produced
 by PCR. The APC gene variants 486, 545 and 1756 are not associated with
 colorectal cancer, but are common polymorphisms which can be used for
 linkage analysis in families with familial adenomatous polyposis. The
 present sequence is a sense scanning oligonucleotide used to detect the
 multiple variant oligonucleotides produced in the present invention

 PT Novel variant of the human pregnane X receptor gene, associated with
 PT insufficient metabolism and/or sensitivity to drugs, is useful for
 PT diagnosing and treating diseases with drugs that are modulators of their
 PT gene product.
 XX
 PS Claim 37; Page 46; 108pp; English.
 XX
 CC AAS02731-AAS02909 represent human pregnane X receptor (hPXR) coding
 CC sequences and PCR primers of the invention. The human pregnane X receptor
 CC sequences are used to make antibodies, or a substance capable of binding
 CC specifically to the gene product of hPXR gene, for diagnosing and
 CC treating various diseases, such as cancer, with drugs that are
 CC substrates, inhibitors or modulators of the hPXR gene product. The
 CC proteins can be used to identify and obtain products and drugs for
 CC treatment of diseases which are amenable to chemotherapy. The nucleic
 CC acids can be used in gene therapy for the treatment or prevention of
 CC disorders associated with hPXR expression

XX Capturing biological binding partner, useful e.g. for nucleic acid
XX hybridization tests, using surface that carries self-assembled monolayer
XX comprising specific capture agent.
XX
XX Example 15; Fig 10; 28pp; English.
XX
XX The invention relates to a new process of capturing a biological binding
XX partner (I) of a nucleic acid strand (II) comprising applying a test
XX sample to a surface that carries: (i) a binding species (III); and (ii) a
XX molecule (IV) that forms a mixed self-assembled monolayer (SAM) with
XX (III). (III) has formula X-R-NA (III) X = functional group that adheres
XX to the surface; R = spacer that promotes formation of SAM; and NA =
XX nucleic acid strand. The method is particularly used in surface plasmon
XX resonance chips (biosensors) for capturing DNA. Typical of many possible
XX applications are DNA hybridisation tests (e.g. diagnostic scanning for
XX mutations, forensic analysis, pharmacological studies, cell sorting,
XX environmental monitoring) in studies of protein-protein interactions
XX where DNA binding is important (e.g. transcriptional control of genes)
XX and in development of easy-analysis DNA computers. The use of a mixed SAM
XX improves sensitivity, with reduced non-specific binding, it ensures that
XX the binding region of (III) is directed away from the surface, making it
XX available for reaction. The present sequence contains a lex B17 binding
XX site and is used to illustrate the method of the invention

XX Conjugates forming self-assembled monolayers on gold surfaces, especially
PT in biosensors, comprise a chelating agent linked via a spacer to a
PT functional group.

XX Example 12; Fig 10; 30pp; English.

XX The invention comprises conjugates which contain a functional group that
XX adheres to a gold surface, a spacer that promotes the formation of a self
XX -assembled monolayer (SAM) of the conjugate, and a bi-, tri- or
XX -adradentate chelating agent that coordinates a metal ion. The
XX conjugates of the invention are useful for forming self-assembled
XX monolayers for capturing biological molecules on sensors, especially
XX surface plasmon resonance sensors. The present DNA sequence is shown in a
XX figure designed to illustrate the formation of a self-assembled monolayer
XX of a conjugate

PT Novel polymerase chain reaction method, for differentiating between
PT microorganisms and for detecting contaminants.
XX
PS Example 1; Page 19; 78pp; German.
XX
CC This invention describes a novel method for the amplification of DNA
CC comprising (i) preparing many primers (P) with different probabilities of
CC amplification and (ii) simultaneous polymerase chain reaction (PCR) of
CC many different DNA using these primers. The method is used (i) to
CC differentiate between different microorganisms in a mixed population and
CC (ii) to determine presence/absence of an impurity (pollutant), or its
CC concentration, in e.g. soil, foods, compost etc., typically metals,
CC agricultural chemicals, polymers, organochlorine compounds etc. A
CC particular use is monitoring composting of organic material.
CC Amplification with many primers produces a lot of information, so
CC reliability of the test is improved, and many samples may be tested
CC quickly. AAZ41640-Z41855 represent the primers described in the method of
CC the invention. (Updated on 20-MAR-2003 to correct PR field.)

PT Amplification of a DNA fragment - in order to establish the state of
PT existence of a microbe.
XX
PS Claim 1; Page 9; 40pp; Japanese.
XX
CC A method has been developed for the amplification of a DNA fragment in
CC which amplification is carried out on the DNA fragments of a number of
CC different DNAs. The method comprises a PCR reaction repeatedly carrying
CC out a heat-denaturing step, a primer annealing step and a polymerase
CC extending step, to amplify the DNA fragments of a plural of different
CC DNAs. The method can detect the existence of a microbe in organic waste.
CC AAZ41424 to AAZ41639 represent PCR primers used in random amplified
CC polymorphic DNA arbitrarily primed PCR, for the detection of microbes in
CC organic waste

DR
XX
XX Identifying, comparing and detecting inhibitors of protein-protein
PT
XX interactions within population of host cells, involves detecting
PT
XX regulation of transcription of nucleic acid sequence by fusion protein
PT
XX interaction.
XX
XX Example; Col 131; 161pp; English.
PS
XX
XX The present invention describes a method for detecting (D) at least 1
CC
XX protein-protein interaction (PPI) by recombinantly expressing within a
CC
XX population of host cells, populations of first and second fusion proteins
CC
XX comprising DNA binding domain (DBD) and transcriptional regulatory domain
CC
XX (TRD) respectively and detecting the regulation of transcription of
CC
XX nucleotide sequence of host cells operably linked to a promoter driven by
CC
XX DBD. The detection method (D) is useful for identifying inhibitors of PPI
CC
XX for therapeutic use, and for detecting specific cell types, tissue types,
CC
XX stage of development and disease states. From the population of the
CC
XX proteins characteristic of the particular tissue or a cell-type, all
CC
XX possible detectable PPI that occur can be identified and genes encoding
CC
XX these proteins can be isolated. Thus, parallel analysis of two cell types
CC
XX enumerates PPI that are common to both and those that are specific to
CC
XX both. This analysis has significant value since PPI specific to a disease
CC
XX state can serve as therapeutic points of intervention. Inhibitors of PPI
CC
XX can also be isolated in rapid fashion. The number of false positives and
CC
XX low throughput are reduced. AAA55943 to AAA55963 and AAY90961 are
CC
XX sequences used in the exemplification of the present invention

DR
XX
XX Detecting protein-protein interactions in protein populations useful for
PT
XX identifying genes encoding the proteins, and inhibitors of the
PT
XX interactions, by detecting transcriptional regulation leading to reporter
PT
XX gene activation.
XX
XX Example; Col 103-104; 135pp; English.
PS
XX
XX The present invention relates to methods for detecting and isolating
CC
XX genes encoding proteins that interact with each other, via the
CC
XX reconstitution of a transcription factor and hence reporter gene
CC
XX activation. Proteins are fused to either the yeast DNA-binding domain of a
CC
XX transcriptional activator or to the activation domain of a
CC
XX transcriptional activator. The present sequence is a linker used in the
CC
XX present invention as an adapter in the analysis of yeast fusion genes.
CC
XX The present method may be used to identify protein-protein interactions
CC
XX and genes encoding the interacting proteins relevant to a particular
CC
XX tissue, stage or disease e.g. cancer

PS
XX
XX This invention relates to a method for amplifying a DNA fragment. The
CC
XX method comprises successive repetitions of heat-denaturing, annealing of
CC
XX a primer and an extending step using a DNA polymerase. The method makes
CC
XX use of a cDNA pool in which the primer is one primer or a pair of primer
CC
XX sets and has an amplification probability which allows it to amplify a

```

CC DNA fragment from a limited number of the cDNAs among the DNA pool (where
 CC the limited number is in the range of 1 to 25). Also included in the
 CC invention are apparatus used for carrying out the method, a primer and a
 CC DNA polymerase and a kit used for amplifying a DNA fragment. The method
 CC can be used to amplify a limited number of cDNAs from a pool in which a
 CC wide variety of cDNAs are present. Oligonucleotides AAC9775 - AAC97990
 CC represent primers used in an example illustrating the method of the
 CC invention

CC This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010
CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
CC represent the oligomers described in the invention. NOTE: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

XX Designing exogenous regulatory molecules for regulating a gene of
XX interest comprises preparation based on identified regulatory sequence
XX elements from accessible regions of chromatin.
XX
XX Example 16; Page 108; 153pp; English.
XX
XX The present invention describes a method for designing exogenous
XX regulatory molecules (ERM) for regulating a gene of interest (I). The
XX method comprises: (a) providing polynucleotide sequences (II)
XX corresponding to accessible regions related to (I); (b) identifying
XX potential regulatory sequence elements (RSE) from (II); and (c) preparing
XX ERM, comprising selecting a DNA binding domain that activates or
XX represses (I), where the preparing comprises selecting the DNA binding
XX domain, the functional domain (or both) based upon the identified RSE.
XX The method can be used for designing one or more ERMs for regulating a
XX gene of interest. The present sequence represents an adapter
XX oligonucleotide, which is used in an example from the present invention

XX
XX Detection of protein to protein interactions amongst two protein
XX populations useful e.g. to identify interactions specific for particular
XX tissues or diseases and to identify inhibitors of interactions uses a new
XX genetic method.
XX
XX Example; Col 203; 152pp; English.
XX
XX The present invention relates to novel methods for detecting protein to
XX protein interactions amongst two populations of proteins, each having a
XX complexity of at least 100. The method involves using new genetic methods
XX in which encoded proteins are fused to either the DNA-binding domain of a
XX transcriptional activator or the activation domain of a transcriptional
XX activator. The methods are useful to detect interacting proteins and to
XX identify protein-protein interactions specific for a particular species,
```

CC tissue, stage of development or disease state, e.g. by comparing protein-
CC protein interactions between populations from cDNA of cancerous or pre-
CC cancerous cells with those from non-cancerous cells. They are also useful
CC to identify inhibitors interfering with protein-protein interactions e.g.
CC potential drug candidates inhibiting interactions specific to cancerous
CC cells. The present sequence is a linker DNA used to illustrate the method
CC of the invention

XX
PT Isolating a collection of polynucleotides corresponding to accessible
XX regions of cellular chromatin, for generating a polynucleotide library
XX and database, comprises using a probe or enzyme.

XX
PS Example 16; Page 116; i62pp; English.

XX
CC The present sequence is that of a double-stranded adaptor oligonucleotide
XX used in a method of the invention for construction of libraries enriched
XX in DNase I-accessible sequences. The invention provides methods for the
XX identification, isolation and characterization of regulatory sequences in
XX a cell of interest. The regulatory sequences are identified based upon
XX their differential accessibility in cellular chromatin compared to other
XX sequences. A rapid method for mapping DNase hypersensitive sites (which
XX can correspond to boundaries of accessible regions) with respect to a

CC particular gene involves ligation of an adaptor to the DNA ends generated
CC by DNase action, followed by amplification using an adaptor-specific
CC primer and a gene-specific primer. The invention also provides libraries
CC of regulatory sequences, databases comprising collections of regulatory
CC sequences for a cell of interest, computer programs for using the
CC databases to conduct genetic analyses, and use of the accessible
CC regulatory sequences in the design of vectors bearing transgenes

XX A recombinant adeno-associated virus-vectored ribozyme composition,
XX useful for treating a disease or dysfunction of the mammalian eye e.g.
XX retinal disease, e.g. diabetic retinopathy or age-related macular
XX degeneration.
XX
XX Example 5; Page 67; 115pp; English.
XX
XX The present invention describes a recombinant adeno-associated virus
XX (AAV) vectored ribozyme composition (I). (I) comprises: (a) at least a
XX first ribozyme that specifically cleaves an mRNA encoding a protein,
XX polypeptide, or peptide selected from the group of rod opsin, INOS,
XX RDS/peripherin, VEGFR1, VEGFR2, adenosine A-2B receptor, IGF-1, integrin
XX alpha 1, integrin alpha 3, integrin alpha 5, or integrin alpha V; (b) a
XX vector comprising a polynucleotide encoding the ribozyme, where the
XX polynucleotide operably positioned downstream of at least a first
XX promoter that directs expression of the polynucleotide in a selected
XX mammalian cell transformed with the vector; (c) a viral particle
XX comprising the ribozyme or the polynucleotide; (d) an AAV vector
XX comprising the ribozyme or the polynucleotide; or (e) a host cell
XX comprising the ribozyme or the polynucleotide. Also described is a method
XX for decreasing the amount of mRNA encoding a selected polypeptide in a
XX retinal cell of a mammalian eye, comprising providing to the eye the
XX composition described above, and for a time effective to specifically
XX cleave the mRNA in the cell. (I) has ophthalmological activity, and can
XX be used in gene therapy. (I) can be used for treating a disease or
XX dysfunction of the mammalian eye, such as a retinal disease or retinal
XX degeneration, (diabetic) retinopathy, or (age-related) macular
XX degeneration. (I) is also useful for manufacturing a medicament for
XX treating the diseases mentioned above, including autosome dominant
XX retinitis or a blood-retinal barrier dysfunction. (I) can also be useful
XX for treating, decreasing the severity, or ameliorating the symptoms of a
XX pathological condition, e.g. atrophic or pigmented lesions of the eye,
XX blindness, a reduction in central or peripheral vision, or a reduction in
XX total vision. ABZ72763 to ABZ72953 represent sequences used in the
XX exemplification of the present invention

XX CC New telomerase reverse transcriptase (TERT) TF-8 and/or TF-13 repressor
XX CC binding site, useful in regulating TERT expression and for screening
XX CC agents that modulate TERT transcription repressing activity of the TF-8
XX CC and TF-13 sites.
XX PS Example; Page 28; 40pp; English.
XX CC The invention relates to a new telomerase reverse transcriptase (TERT) TF
XX CC -8 and/or TF-13 repressor binding site. The nucleic acid comprising the
XX CC binding site sequence is useful in preparing constructs, such as vectors
XX CC and expression systems, and probes for the TERT TF-8 and/or TF-13
XX CC repressor binding site in non-human animals. Modulating the transcription
XX CC repressing activity of TERT TF-8 and/or TF-13 repressor factors to
XX CC regulate telomerase expression, can be used in immortalization of cells,
XX CC production of reagents useful in life science research, and therapeutic
XX CC research. Inhibitors of TERT transcription repression by a TF-8 and/or TF
XX CC -13 repressor may be used for increasing the proliferative capacity of a
XX CC cell, and for treating progeria, Hutchinson-Gilford syndrome,
XX CC cardiovascular disease, osteoporosis, or AIDS. The present sequence
XX CC represents a sequence inserted upstream of an ATG codon, after the TERT
XX CC minimal promoter, to optimise translation

 XX Identifying tumour metastatic sequences - by introducing transfected
 PT cells into host mammal and analysing primary and metastatic sequences by
 PT differential display PCR.
 XX Example 3; Page 30; 102pp; English.
 PS Mouse Urogenital Sinus (UGS) tissue was isolated from 17 day old mouse
 CC embryos. The UGS cells were infected with retroviruses, cultured and
 CC implanted under the renal capsule of mice. Reconstitutions were harvested
 CC 5 weeks later, when they showed signs of distress from the tumour burden.
 CC Metastatised tumours were isolated from a site outside the renal capsule.
 CC RNA was isolated from primary tumours and metastases, reverse transcribed
 CC and subjected to differential display PCR, using the primers AAT69119-42.
 CC The sequences were analysed to obtain metastatic sequences. The method
 CC can be used to detect, diagnose and treat disorders related to
 CC metastasis, or treat malignant or non-malignant disorders, e.g.
 CC hyperplasia, dysplasia and hypertrophy. The metastatic sequence can be
 CC used to screen a biological sample for metastasis, and it or its
 CC expression product may also be used to treat a metastatic disorder

 XX New DNA sequences isolated from endogenous human retroviral element - and
 PT related vectors, transformed cells, proteins and antibodies, useful for
 PT diagnosis, treatment and prevention of breast cancer.
 XX
 PS Example 1; Page 69; 173pp; English.
 XX
 CC The present sequence represents a PCR primer for human breast tumour cDNA
 CC nucleotide sequences. The present invention describes nucleotide
 CC sequences which encode human breast tumour specific polypeptides.
 CC Detection or measurement of human breast tumour specific polypeptides and
 CC nucleotide sequences, or the corresponding RNA in a sample, is used for
 CC diagnosis and monitoring of breast cancer. Human breast tumour specific
 CC polypeptides and nucleotide sequences, and the vectors containing the
 CC DNAs, are also useful in vaccines for inhibiting development (for
 CC prevention or therapy) of breast cancer. The polypeptides may also be
 CC used to raise monoclonal antibodies, used as immunoassay reagents

| PT | Diagnosis of cancer in potentially neoplastic samples - by comparing the |
| XX | level of transcription between RNA transcripts in two tissue samples, |
| PT | useful for providing an extensive profile of gene expression in rat |
| PT | embryo fibroblast (REF) cells. |
| PS | |
| XX | Example 2; Page 15; 32pp; English. |
| XX | |
| CC | A method has been developed for the diagnosis of cancer in potentially |
| CC | neoplastic samples. The method comprises comparing the level of |
| CC | transcription between RNA transcripts in two tissue samples (which are of |
| CC | the same type), where the first sample is potentially neoplastic, and the |
| CC | second sample is normal human tissue. The first sample is categorized as |
| CC | neoplastic if its level of transcription is lower than that of the second |
| CC | sample. The transcript is selected from Alb, RAS, U6 snRNA, 16S rRNA, BGR- |
| CC | 1, ribosomal protein S27, ETS-1, 28S rRNA, CGR11, and LIMK-2, and it is |
| CC | identified by a tag selected from ribosomal protein l13a, alpha-tubulin |
| CC | (T1) and (T2), thymosin beta-4, and gamma- actin. The present sequence |
| CC | represents a serial analysis of gene expression (SAGE) tag from the |
| CC | present invention. The use of SAGE tags provides an extensive profile of |
| CC | gene expression in rat embryo fibroblast (REF) cells containing the (non) |
| CC | -functional p53 tumour suppression gene. The discovery of new SAGE tags, |
| CC | which are regulated by p53, enables the diagnosis of genes that are |
| CC | related to cell cycle control and tumourigenesis |

 PT stranded analyte - and hybrid of anchor and reporter sequences, with
 PT reporter released if triplex formation occurs, used e.g. to identify
 PT bacteria.
 XX
 XX Disclosure; Col 23-24; 168pp; English.
 PS
 XX The present sequence represents a potential triple-helix forming region.
 CC It can be used to demonstrate the assay of the invention. The assay
 CC comprises adding a sample containing double-stranded DNA test sequences,
 CC e.g. containing the present sequence, to an aqueous medium containing at
 CC least one complex of anchor DNA, attached to a solid support, and
 CC reporter DNA, where either a part of the anchor DNA or reporter DNA is
 CC designed to form a triple-strand structure with part of the test
 CC sequence. Triplex formation results in displacement of the reporter DNA
 CC which is detected as an indication of the presence of the DNA test
 CC sequence. The method is used to detect DNA sequences, particularly for
 CC identification of bacteria (by detecting genes for ribosomal RNA) in
 CC clinical samples, but also detection of oncogenes and Hepatitis B virus.

PT Detection of mycoplasma-specific or prokaryote-specific nucleic acids -
PS using mycoplasma-specific or prokaryote-specific probes.
XX
XX Claim 3; Col 8; 11pp; English.
XX
CC This sequence represents a probe based on prokaryotic 16S RNA genes that
CC can be used in the method of the invention. The method is for detecting
CC the presence of prokaryotic specific nucleic acids, and comprises: (a)
CC contacting a medium, which may contain a nucleic acid or nucleic acid
CC fragment from the prokaryote having a particular nucleotide sequence,
CC with an oligonucleotide comprising a nucleotide sequence complementary to
CC the particular nucleotide sequence, whereby the oligonucleotide
CC hybridises with any nucleic acid or nucleic acid fragment from the
CC prokaryote which may be present in the medium; and (b) detecting the
CC presence of any nucleic acid or nucleic acid fragment hybridised with the
CC oligonucleotide. The invention also relates to a method for determining
CC the presence of a mycoplasma. The detection process is useful for
CC contaminated cell cultures or other biological environments. The probes
CC can be used in the diagnosis of bacteraemia or septicaemia in mammals.
CC The process provides a rapid, simple, effective, sensitive and specific
CC mycoplasma detection system. The probes can be made specific for
CC individual mycoplasma, acholeplasma, ureaplasma, spiroplasma, and
CC eubacterial species

DR Isolated polynucleotides differentially expressed in antigen-presenting
 PT cells, useful in gene vaccines against cancer.

XX Claim 1; Page 125; 130pp; English.

XX Sequences AAZ77573-779709 represent SAGE (serial analysis of gene
 CC expression) tags used to identify mRNA transcripts encoding
 CC immunostimulatory cofactor proteins which are preferentially or
 CC differentially expressed in monocyte-derived dendritic cells compared
 CC with monocytes. Some of the transcripts correspond to known genes or ESTs
 CC (expressed sequence tags) which were previously unknown to be
 CC preferentially or differentially expressed in dendritic cells, while
 CC other transcripts correspond to novel genes. Antigen-presenting cell
 CC (APC)-associated costimulatory factors play an important role in the
 CC activation of the cytotoxic immune response, particularly against tumour
 CC cells. Tumour antigen presentation via the MHC (major histocompatibility
 CC complex) and subsequent recognition by T-cell receptors is alone
 CC insufficient to activate a robust cytotoxic immune response that can lyse
 CC the tumour cells, immunostimulatory cofactors also being required for
 CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
 CC sequences identified using the SAGE tags have several potential uses.
 CC They may be used in vaccines to induce an immune response, particularly
 CC against a tumour antigen; to modulate the genotype of an APC; to screen
 CC for agents that modulate expression of differentially expressed genes in
 CC an APC; and as hybridisation probes/amplification primers for the
 CC diagnosis, prognosis and monitoring of diseases related to abnormal
 CC expression of these genes. Detection of the dendritic cell differentially
 CC expressed genes, or of their encoded proteins, can be used to identify
 CC cells as belonging to the monocyte lineage. Cells containing these genes
 CC can be used in active immunotherapy (or to stimulate production of a
 CC population of antigen-specific effector cells) and vectors containing
 CC them are used in gene therapy. Co-administration of tumour antigens and
 CC APC-associated costimulatory factors ensures adequate antigen
 CC presentation to endogenous APCs and upregulates the APCs for the
 CC presentation of co-stimulatory signals, migration to T cell-rich sites,
 CC secretion of T cell growth factors and secretion of chemokines for
 CC recruitment of immune effector cells

XX
XX Isolated polynucleotides differentially expressed in antigen-presenting
PT cells, useful in gene vaccines against cancer.
XX
XX Claim 1; Page 65; 130pp; English.
XX
XX Sequences AA277573-279709 represent SAGE (serial analysis of gene
CC expression) tags used to identify mRNA transcripts encoding
CC immunostimulatory cofactor proteins which are preferentially or
CC differentially expressed in monocyte-derived dendritic cells compared
CC with monocytes. Some of the transcripts correspond to known genes or ESTs
CC (expressed sequence tags) which were previously unknown to be
CC preferentially or differentially expressed in dendritic cells, while
CC other transcripts correspond to novel genes. Antigen-presenting cell
CC (APC)-associated costimulatory factors play an important role in the
CC activation of the cytotoxic immune response, particularly against tumour
CC cells. Tumour antigen presentation via the MHC (major histocompatibility
CC complex) and subsequent recognition by T-cell receptors is alone
CC insufficient to activate a robust cytotoxic immune response that can lyse
CC the tumour cells, immunostimulatory cofactors also being required for
CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
CC sequences identified using the SAGE tags have several potential uses.
CC They may be used in vaccines to induce an immune response, particularly
CC against a tumour antigen; to modulate the genotype of an APC; to screen
CC for agents that modulate expression of differentially expressed genes in
CC an APC; and as hybridisation probes/amplification primers for the
CC diagnosis, prognosis and monitoring of diseases related to abnormal
CC expression of these genes. Detection of the dendritic cell differentially
CC expressed genes, or of their encoded proteins, can be used to identify
CC cells as belonging to the monocyte lineage. Cells containing these genes
CC can be used in active immunotherapy for to stimulate production of a
CC population of antigen-specific effector cells) and vectors containing
CC them are used in gene therapy. Co-administration of tumour antigens and
CC APC-associated costimulatory factors ensures adequate antigen
CC presentation to endogenous APCs and upregulates the APCs for the
CC presentation of co-stimulatory signals, migration to T cell-rich sites,
CC secretion of T cell growth factors and secretion of chemokines for
CC recruitment of immune effector cells

 CC treatment of breast cancer, particularly where metastatic. Diagnosis is
 CC by standard immunoassays or hybridisation/amplification reactions.
 CC Compounds that modulate expression of the transcripts are potentially
 CC useful for treatment of (metastatic) breast cancer, while promoters from
 CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences),
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

PT treatment of cancer.
XX
PS Claim 1; Page 68; 219pp; English.
XX
CC AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
CC that are preferentially transcribed in the metastatic breast tumour
CC tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
CC to AAZ86677 represent tags corresponding to distinct transcripts that are
CC preferentially transcribed in the primary or non-metastatic breast tumour
CC tissue (i.e. are downregulated in metastatic breast tumour cells). These
CC transcripts can be used for diagnosis, prognosis, monitoring and
CC treatment of breast cancer, particularly where metastatic. Diagnosis is
CC by standard immunoassays or hybridisation/amplification reactions.
CC Compounds that modulate expression of the transcripts are potentially
CC useful for treatment of (metastatic) breast cancer, while promoters from
CC the transcripts are used to direct expression, in selected cell types, of
CC e.g. therapeutic genes (also ribozymes or antisense sequences),
CC particularly an antigen-encoding sequence for use in gene or cell-based
CC vaccines. Polypeptides encoded by the transcripts are also useful in
CC vaccines; for diagnosing breast cancer and for raising specific
CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
CC agents. Host cells that produce the polypeptides can be used to expand
CC and isolate populations of educated, antigen-specific immune effector
CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
CC immunotherapy

XX by standard immunoassays or hybridisation/amplification reactions.
XX Compounds that modulate expression of the transcripts are potentially

CC by standard immunoassays or hybridisation/amplification reactions.
 CC Compounds that modulate expression of the transcripts are potentially
 CC useful for treatment of (metastatic) breast cancer, while promoters from
 CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences).
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines. Polypeptides encoded by the transcripts are also useful in
 CC vaccines; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

 PS
 XX The present invention describes a group of genes consisting of 100 genes which are highly expressed in human dendritic cells; a group of genes which are expressed at a higher frequency in human dendritic cells than in human monocytes; and a group of genes which are expressed at lower frequency in human dendritic cells than in human monocytes. Each group of genes are characterised in that cDNAs of these genes respectively have the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114 to AAC74213), each is continuous with the base sequence 5'-CATG-3', located most closely to the poly-A region. The sequences can be used for the investigation of the role and mechanism of the involvement of dendritic cells in the immune system and for the study and diagnosis of diseases in which dendritic cells play a significant role, e.g. cancers

XX An isolated polypeptide comprising an immunogenic portion of a breast

PT tumor protein used for inhibiting the development of cancer, especially

PT breast cancer, and monitoring cancer progression in a patient.

XX Example 1; Page 33; 187pp; English.

PS The present sequence is a PCR primer which was used in the isolation of

CC human breast tumour-specific antigens. Methods for the treatment and

CC diagnosis of breast cancer are disclosed. Nucleotide sequences that are

CC preferentially expressed in breast tumour tissue, and the polypeptides

CC encoded by such nucleotide sequences, are used in compositions and

CC vaccines to inhibit the development of cancer, especially breast cancer.

CC The progression of a cancer may be monitored by carrying out detection of

CC tumour-specific antigens at subsequent time points and comparing the

CC results from the different time points. CD4+ and/or CD8+ T-Cells isolated

CC from the cancer patient may be treated with tumour-specific polypeptides,

CC polynucleotides encoding the polypeptides or antigen presenting cells

CC expressing the polypeptides. The cells are then administered to the

CC patient to inhibit development of cancer

PT Novel method of identifying target epitopes or antigens specific for

PT human tumors, cancers and infected cells involving screening expression

PT library products of a cell expressing the target epitope.

XX

PS Disclosure; Page 68; 132pp; English.

XX

XX AA15239-50 represent arbitrary primers which are used for modified

CC differential display of tumour antigens, in the method of the invention.

CC The specification describes a method for identifying a target epitope.

CC The method comprises screening the products of an expression library from

CC a cell expressing the target epitope with cytotoxic T cells generated

CC

CC against the cell to identify DNA clones expressing the target epitope.

CC The method may also comprise providing a cytotoxic T cell specific for a

CC gene product differentially expressed by a cell and measuring the cross-

CC reactivity of the cytotoxic T cell. The methods are useful for

CC identifying tumour specific target epitopes and antigens which are useful

CC in immunogenic compositions or vaccines to induce the regression of

CC tumors, cancers or infections in mammals. The genes expressed in a panel

CC of tumour cells that are derived from single immortalised, non-

CC tumorigenic cell line are used to generate HLA restricted cytotoxic T

CC cells which are evaluated for activity against tumour cells. The method

CC is useful to identify potential antigens expressed not only by the

CC pathogen but also by the host cells whose gene expression is altered as a

CC result of infection. The differential gene expression strategies can be

CC applied to identify immunogenic molecules of cells infected with virus,

CC fungus or mycobacterium

DR

XX Novel differential display reverse transcription PCR method used to

PT detect genes expressed in mutant tissues.

PT

XX Disclosure; Page 26; 40pp; English.

PS

XX This sequence represents decamer D14, which was used in a novel

CC differential display RT-PCR (DDRT-PCR) method of detecting genes

CC expressed in tissues, especially mutant tissue. RNA isolated from adult

CC male w/wv azoospermic mutant mice testis was subjected to reverse

CC transcription. 324 PCRs were performed on the resulting cDNA using 3'

CC clamp primers (see 23467-69) and variable decamer 5' primers D1-D26 (see

CC AA234670-95). Differentially expressed clones were used as probes in

CC northern hybridisation, and a novel gene product that was preferentially

CC upregulated in w/wv mouse testis was identified and termed Alzheimer-

CC associated beta-amyloid binding protein (ERAB, see AA232239)

XX DT Generating oligonucleotide probes, which are useful in DNA hybridization
PT techniques for detecting mycoplasmas or prokaryotes in general.
XX PS Disclosure; Col 2; 6pp; English.
XX CC The present invention describes a method for obtaining oligonucleotide
CC probes, comprising synthesising and isolating an oligonucleotide
CC comprising a sequence identical to a sequence identified as hybridisable
CC under predetermined conditions to a nucleotide sequence from one or more
CC target organisms. The oligonucleotide probes are hybridisable to a
CC nucleotide sequence contained by or specific to one or more target
CC organisms but not to one or more selected non-target organisms in a
CC sample. The target and non-target organisms do not have a cellular
CC nucleus or are no higher phylogenetically than prokaryotes. The method
CC comprises: (a) obtaining particular nucleotide sequence information of
CC one or more of the target organisms; (b) obtaining particular nucleotide
CC sequence information of one or more of the selected non-target organisms;
CC (c) comparing the target and non-target sequence information and
CC identifying from it at least one oligonucleotide sequence that is
CC hybridisable under the predetermined conditions to a nucleotide sequence
CC from the target organisms, but not to a nucleotide sequence of non-target
CC organisms; and (d) synthesising and isolating an oligonucleotide
CC comprising a sequence identical to the identified sequence. The method
CC can be used for generating oligonucleotide probes for detecting
CC mycoplasmas or prokaryotes in general. The present sequence represents an
CC Escherichia coli 16S RNA gene oligonucleotide which is given in the
CC exemplification of the present invention

XX PT useful for detecting specific nucleic acids, e.g. for single-nucleotide
XX PT mismatch discrimination.
XX XX Disclosure; Page 58; 105pp; English.
XX CC The present sequence is that of the oligonucleotide (ODN) component of an
XX CC ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
XX CC invention. MGBs bind in a non-intercalating manner to the minor groove of
XX CC non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
XX CC but in an intercalating manner, or lies in the minor groove, or is
XX CC oriented in some other way to the DNA molecule by MGB, such that it
XX CC becomes fluorescent (or its fluorescent properties change detectably).
XX CC The conjugates are used as hybridisation probes and amplification primers
XX CC for fluorescent detection of specifically hybridising sequences, for
XX CC analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
XX CC mismatch discrimination, target or signal amplification, array-based
XX CC assays and sequencing, including detection of double-stranded DNA by
XX CC triplex formation. Many different targets can be detected a single
XX CC reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
XX CC hybridisation-triggered fluorescence. Upon hybridisation to the
XX CC complementary target sequence there was an increase in fluorescence
XX CC yield, measured as the ratio of the fluorescence emitted by the hybrid
XX CC between the ODN-MGB-LF conjugate and its target sequence to the
XX CC fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,

XX DR New isolated polynucleotides, useful for identifying specific cell type,
XX PT such as cancer cell, comprises transcriptomes expressed in particular
XX PT cell types.
XX PS Claim 13; Page 59; 94pp; English.
XX CC The present invention describes a method of identifying the type of cell
XX CC in a sample, involving determining which of the sequences AAH63161-
XX CC AAH64724 is expressed by the cell. The transcriptomes described in the
XX CC invention are cell-type specific, cancer specific or ubiquitously
XX CC expressed in humans. They can also be used to screen for drugs, reduce
XX CC cancer specific gene expression, standardise expression and restore the
XX CC function of a diseased cell or tissue. The present sequence is one of the
XX CC transcriptomes described in the exemplification of the invention
